STUDENT PROJECT REPORT

Individual Contribution Report — MiniOS NeOS Project

Student Name: Neo Sebastiene C. Halaba

Group: NeOS

Assigned Role: Student 1 — Project Leader

1. What did I contribute to the project?

As the project leader, I coordinated the group's activities and ensured that each member understood their responsibilities. I monitored our progress, reminded members about deadlines, organized our project files, and helped combine everyone's contributions into one complete Mini OS NeOS project. I also reviewed the final version to ensure that the files were organized and the project was ready for submission.

2. What features did I personally develop?

My primary contribution was managing and integrating the project. I helped combine the different components of MiniOS, checked how the command-line interface worked with the supporting modules, and reviewed the user documentation. I also helped ensure that the project was organized and that the final output reflected the group's collective work.

3. What problems did I encounter?

One of the main challenges I encountered was coordinating the group and ensuring that tasks were completed on time. Combining different parts of the project also required careful checking to identify missing files, inconsistent commands, and possible integration issues. Another challenge was making sure that the final project and its documentation were complete and understandable.

4. How did I solve those problems?

I addressed these challenges by communicating with group members, monitoring task progress, reminding everyone about deadlines, and reviewing the combined project. I helped identify issues that needed correction and coordinated with the responsible members to resolve them. Before submission, I checked the overall project and reviewed the user manual to help ensure that the final output was organized and complete.

5. What did I learn from this project?

Through this project, I learned that being a project leader requires responsibility, communication, time management, teamwork, and problem-solving skills. I also learned that software development involves more than programming because organizing files, integrating features, testing the system, and preparing documentation are important parts of completing a successful project. This experience helped me understand the importance of cooperation and leadership in software development.

6. Evidence of my contribution

My contributions can be demonstrated through the group's task assignments, project-related communications, deadline reminders, combined source files, review notes, the final MiniOS project, and the **User_Manual.pdf** prepared for users. Screenshots of the project files, group coordination, and final testing can also serve as supporting evidence of my responsibilities as project leader.
