Individual Contribution Report

Name: Paul Nazarene S. Jordan
Group: NeOS
Assigned Role: Student 4 – Process and Memory Developer

1. What did I contribute to the project?

My contribution to the MiniOS project was focused on developing the process management and memory management components of the operating system. I was responsible for implementing the features related to creating and managing processes, running programs, terminating processes, and handling memory allocation and deallocation.

2. What features did I personally develop?

- **Process:** Handles the management and tracking of processes in MiniOS.
- **Run:** Allows users to execute or run a process or program.
- **Kill:** Allows users to terminate a running process.
- **Memory:** Displays or manages memory-related information.
- **Allocate:** Handles the allocation of memory for processes or programs.
- **Free:** Releases allocated memory when it is no longer needed.

3. What problems did I encounter?

While working on my assigned tasks, I encountered challenges in understanding how process management and memory management should work together. Another challenge was ensuring that the commands behaved correctly and handled different situations, such as running or terminating processes and allocating or freeing memory.

4. How did I solve those problems?

I addressed these challenges by reviewing the requirements of each command and dividing the tasks into smaller parts. I focused on understanding the purpose of each feature before implementing its functionality.

5. What did I learn from this project?

Through this project, I learned more about the basic concepts of operating systems, especially process management and memory management. I gained a better understanding of how processes are executed and terminated, as well as how memory can be allocated and released.

6. Evidence of my contribution

- Source code for the `process` feature.
- Source code for the `run` and `kill` commands.
- Source code for the `memory`, `allocate`, and `free` commands.
- Screenshots showing the commands running and producing the expected output.
- Test results demonstrating process execution, process termination, memory allocation, and memory deallocation.
- Git commits or version history showing the changes I made to the project.
